Pharmaceuticals and Personal Care Products

PPCPs are a highly diverse group of chemicals

Basically all prescription and over-the-counter drugs

Illicit Drugs

Diagnostic agents

Dietary Supplements

Fragrances, soaps, conditioners, sunscreens, cosmetics...

Caffeine

Nicotine

Common Routes of Entry Into the Environment Include

- **Wastewater**
 - Domestic and industrial wastewater, sewer overflows, septage, and storm water
 - Either excreted, rinsed, or purposely flushed
- **Municipal landfills**
 - Leachate to ground water
- **Manure, biosolids and pet waste**
 - Concentrated animal feedlot operations
 - Land application then through groundwater or runoff

Science progresses in stages

Historical Approach

- Analytical methods had to be developed to detect PPCPs in environmental media (e.g., water, soil, sediment, organisms)
- This is often quite difficult at low concentrations
- Receiving water concentrations are typically in the ppt to low ppb range
- Extracting and measuring contaminants in soils, sediments, and tissues is more difficult than pure water.
- The signal is often harder to pick up given all the extra noise created by the interferences in the environmental media.

1 part per billion =

1¢ in \$10,000,000 or

1 second in 32 years or

1 drop of gas in the largest gas tanker truck

1 part per trillion =

1 trillion seconds ago, it was around 30,000 BC

1 drop of ink divided into 20 Olympic-size swimming pools

Science progresses in stages, cont.

- Once the chemical could be detected, its fate had to be determined
 - Does it rapidly degrade, persist, or accumulate?
 - Does it pass through WWTPs?
 - Does it bind readily with soil?
 - Does it partition to the sediment or biological tissues?

Science progresses in stages, cont.

Ramirez, A J. et al., 2009

(The following table content is heavily blurred and illegible. It appears to be a multi-column table with several rows of data.)

Environmental Toxicology and Chemistry, Vol. 28, No. 12, pp. 2587–2597, 2009

Science progresses in stages, cont.

- Once a compound could be detected and something was known about its fate, research could begin measuring the exposure of organisms to the chemical and determining what effects could be observed **at environmentally relevant concentrations**
- Studies documenting the biological effects of PPCPs in natural systems have only started being published fairly recently

Fate and Effects of PPCPs in the Aquatic Environment

- Field studies are often difficult to interpret due to the lack of ability to control many environmental variables
- Translating the biological effects of exposure to organisms in laboratory experiments to actual environmental effects in natural systems can be very difficult as well

Table 2 | Reported subtle effects of pharmaceutical compounds on aquatic and terrestrial organisms

| Substance(s) | Medicine class | Reported effect | Reference |
|--|-------------------------|--|--|
| Fenfluramine | Anorexic | Enhances release of serotonin (5-HT) in crayfish which in turn triggers the release of ovary-simulating hormone resulting in larger oocytes with enhances amounts of vitellin In fiddler crabs, stimulates the production of gonad-stimulating hormone accelerating testicular maturation | Daughton & Ternes, 1999 |
| 17 α -Ethinylestradiol | Synthetic steroid | Endocrine-disrupting effects on fish, reptiles and invertebrates | Young <i>et al</i> , 2002 |
| Methyltestosterone | Synthetic steroid | Impersex, reduced fecundity, oogenesis, spermatogenesis in snails | Schulte-Oehlmann <i>et al</i> , 2004 |
| Avermectins | Parasiticide | Adults insects: loss of water balance, disruption of feeding and reduced fat accumulation, delayed ovarian development, decreased fecundity and impaired mating Juvenile insects: delayed development, reduced growth rates, development of physical abnormalities, impairment of pupariation or emergence and a loss of developmental symmetry | Floate <i>et al</i> , 2005 |
| Tetracyclines, macrolides and streptomycin | Antibacterials | Antibacterial resistance measured in soil bacteria obtained from sites treated with pig slurry | Sengelov <i>et al</i> , 2003 |
| Cypermethrin | Ectoparasiticide | Impact on dung decomposition | Sommer & Bibby, 2002 |
| Fenbendazole | Parasiticide | Impact on dung decomposition | Sommer & Bibby, 2002 |
| Tylosin | Antibacterial | Impacts on the structure of soil microbial communities | Westergaard <i>et al</i> , 2003 |
| Erythromycin | Antibacterial | Inhibition of growth cyanobacteria and aquatic plants | Pomati <i>et al</i> , 2004 |
| Tetracycline | Antibacterial | Inhibition of growth cyanobacteria and aquatic plants | Pomati <i>et al</i> , 2004 |
| Ibuprofen | Anti-inflammatory | Stimulation of growth of cyanobacteria and inhibition of growth of aquatic plants | Pomati <i>et al</i> , 2004 |
| Fenofibrate | Lipid regulator | Inhibition of basal EROD activity in cultures of rainbow trout hepatocytes | Laville <i>et al</i> , 2004 |
| Carbamazepine | Analgesic | Inhibition of basal EROD activity in cultures of rainbow trout hepatocytes Inhibition of emergence of <i>Chironomus riparius</i> | Laville <i>et al</i> , 2004; Nentwig <i>et al</i> , 2004 |
| Diclofenac | Analgesic | Inhibition of basal EROD activity in cultures of rainbow trout hepatocytes | Laville <i>et al</i> , 2004 |
| Propranolol | Beta blocker | Weak EROD inducer in cultures of rainbow trout hepatocytes | Laville <i>et al</i> , 2004 |
| Sulphamethazole | Antibacterial | Inhibition of basal EROD activity in cultures of rainbow trout hepatocytes | Laville <i>et al</i> , 2004 |
| Clofibrate | Lipid regulator | Inhibition of basal EROD activity in cultures of rainbow trout hepatocytes | Laville <i>et al</i> , 2004 |
| Diazepam | Antianxiety drug | Inhibition in the ability of dissected polyps from the cnidarian <i>Hydra Vulgaris</i> to regenerate a hypostome, tentacles and a foot | Pascoe <i>et al</i> , 2003 |
| Digoxin | Cardiac glycoside | Inhibition in the ability of dissected polyps from the cnidarian <i>Hydra Vulgaris</i> to regenerate a hypostome, tentacles and a foot | Pascoe <i>et al</i> , 2003 |
| Amlodipine | Calcium channel blocker | Inhibition in the ability of dissected polyps from the cnidarian <i>Hydra Vulgaris</i> to regenerate a hypostome, tentacles and a foot | Pascoe <i>et al</i> , 2003 |

Rapid Rate of New Chemical Production

- New chemicals (including pharmaceuticals) are being developed and produced at an unprecedented rate
- Chemical Abstracts Service registers new chemicals
- It took 33 years for CAS to register the 10 millionth compound in 1990. CAS registered the 40 millionth compound in November 2008. Nine months later, CAS registered its 50 millionth chemical compound

Millions of Chemicals Added to CAS Registry

Potential Revised Approach

- Supplement analysis for specific commonly used PPCP compounds with analyses for indicators of combined effects for specific classes of compounds
- Test for overall estrogenicity (feminizing) or androgenicity (masculinizing)
- Measure abnormalities in reproductive tissues
- Measure hormones and biomarkers in fish serum

Photographer: Jo Ellen Hinck (vog.sgsu@kcnihj), U.S. Geological Survey

Types of Biological Effects Observed

PPCPs are capable of producing a wide variety of intentional and unintentional effects in humans, animals, and plants.

- **Direct toxicity (death, reduced growth or reproduction)**
- **Disruption of the Endocrine System**
 - Endocrine Disrupting Compounds (EDCs) cause changes in hormone levels that, depending upon the exposed organism's stage of development, exposure to EDCs may cause temporary or permanent effects
- **Suppression of Immune System**
 - Reduced ability to fend off disease
- **Decreased predator avoidance behavior**
- **Increased Antibiotic Resistance**
 - Bacterial populations become less susceptible to antibiotics through repeated sub-lethal exposures

Endocrine Disrupting Compounds

Effects from EDCs are typically the easiest to observe

- Birth control pills contain natural and/or synthetic hormones and are designed specifically to regulate hormone levels in women
- It is not uncommon for these hormones to pass through wastewater treatment plants in the low part per trillion range (typically less than 5 ppt)
- Laboratory studies have demonstrated reduced reproductive success in fishes exposed to <5 ppt of the synthetic estrogen 17 β -ethynylestradiol (EE2) and feminization of male fishes have been observed in waterways receiving wastewater plant effluent, but direct cause and effect evidence in natural systems was lacking.

Canadian Lake Study

- Karen Kidd *et al*, 2007 conducted a 7-year whole lake study in Ontario, Canada and demonstrated that chronic exposure to 5-6 ppt of EE2 resulted in the near total collapse of the exposed fathead minnow population

Canadian Lake Study, cont.

Fig. 3. Length frequency distributions of fathead minnow captured in trap nets in reference Lake 442 (A) and Lake 260 (B) (amended with 5–6 ng-L⁻¹ of EE2 in 2001–2003) during the fall of 1999–2005. Distributions for each fall have been standardized to 100 trap-net days. Mean ± SE daily trap-net CPUE data for adults and juveniles for the fall catches are shown in the panels.

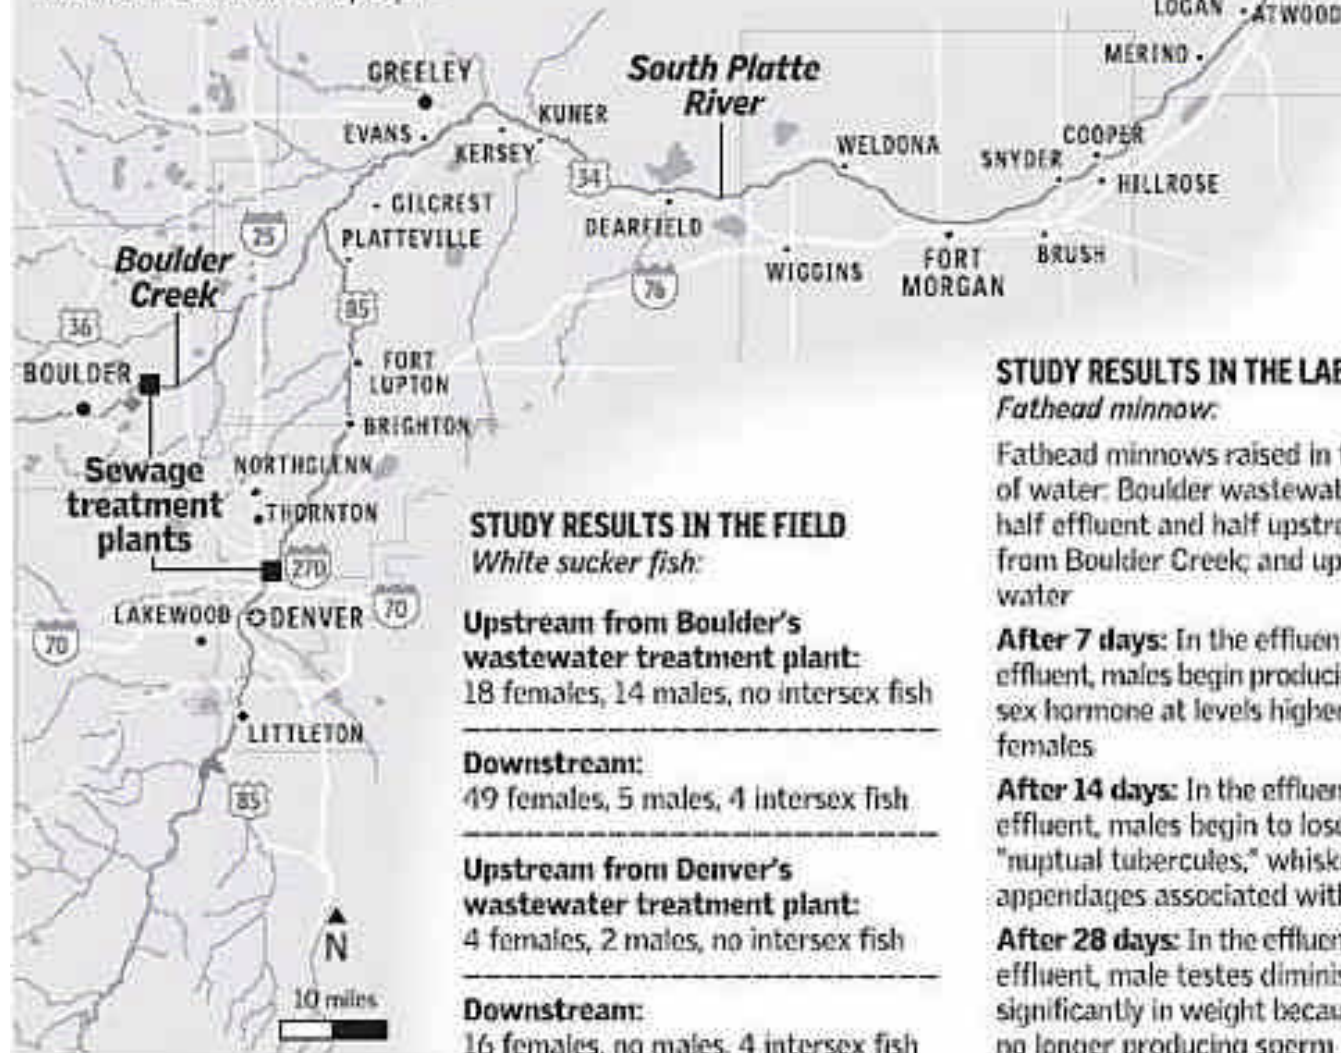

Boulder Creek, Colorado

- USGS and Colorado University studies on the fate and effects of PPCP's in a WWTP discharging into Boulder Creek, near Boulder, CO
- White Sucker population downstream of municipal wastewater outfall found to have highly skewed sex ratio (proportion of male to female fish) when compared to upstream reference sites

Gender-bending pollution

Strange fish live downstream from Boulder and Denver sewage plants, a new study reports. Researchers found white sucker fish with sexual deformities and far more female fish than males in certain sections of Boulder Creek and the South Platte. New work identifies hormone-laden wastewater treatment effluent as the cause. Utilities aren't required to test for the chemicals, but federal officials are supporting more research to learn where the contaminants come from, how much is cleaned up in the treatment process and whether the contaminated river water could affect people.

STUDY RESULTS IN THE FIELD

White sucker fish:

Upstream from Boulder's wastewater treatment plant:
18 females, 14 males, no intersex fish

Downstream:
49 females, 5 males, 4 intersex fish

Upstream from Denver's wastewater treatment plant:
4 females, 2 males, no intersex fish

Downstream:
16 females, no males, 4 intersex fish

STUDY RESULTS IN THE LABORATORY

Fathead minnow:

Fathead minnows raised in three types of water: Boulder wastewater effluent; half effluent and half upstream water from Boulder Creek; and upstream water

After 7 days: In the effluent and dilute effluent, males begin producing a female sex hormone at levels higher than most females

After 14 days: In the effluent and dilute effluent, males begin to lose their "nuptial tubercles," whisker-like appendages associated with mating

After 28 days: In the effluent and dilute effluent, male testes diminish significantly in weight because they are no longer producing sperm

White sucker
(*Catostomus commersoni*)

White suckers are the only fish found at some of the sites where wastewaters enters rivers, so field scientists compared sucker numbers, gender and physiology above and below wastewater treatment plants. Suckers grow between 12 and 20 inches long.

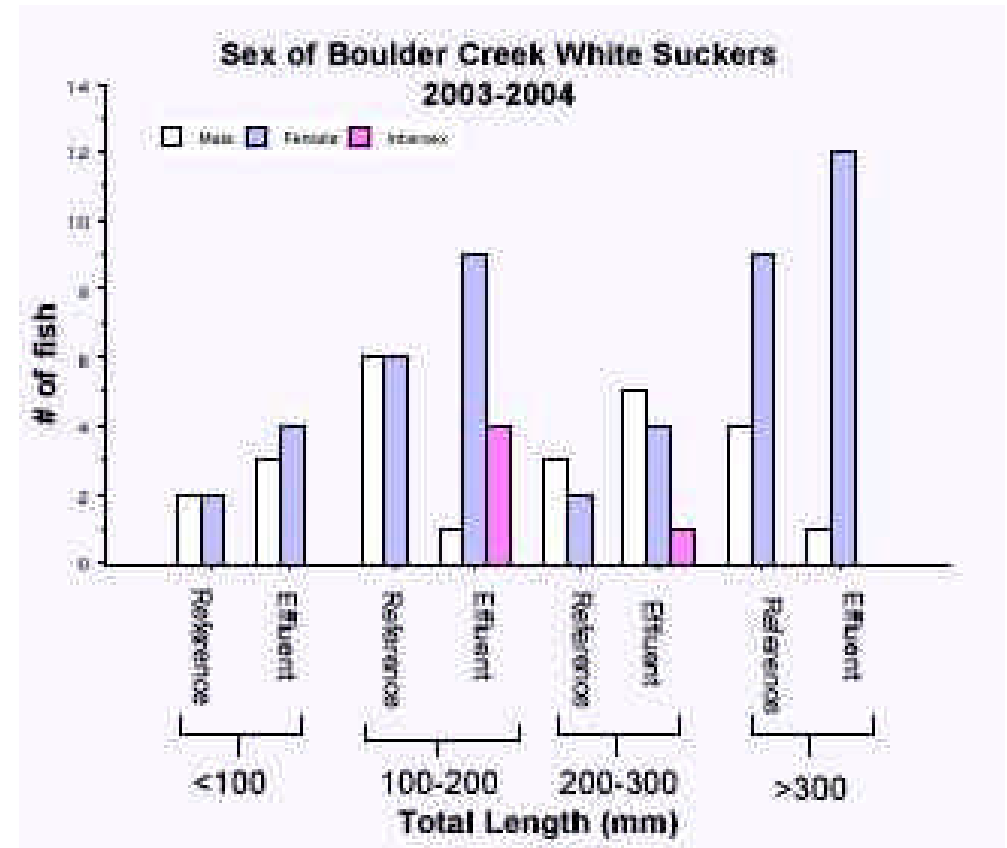

Fathead minnow
(*Pimephales promelas*)

Captive-bred fathead minnows are the EPA's test organism, used in controlled experiments. The small, quick-growing fish (about 2 to 3 inches long) are the "lab mice" of aquatic science.

Boulder Creek, Colorado

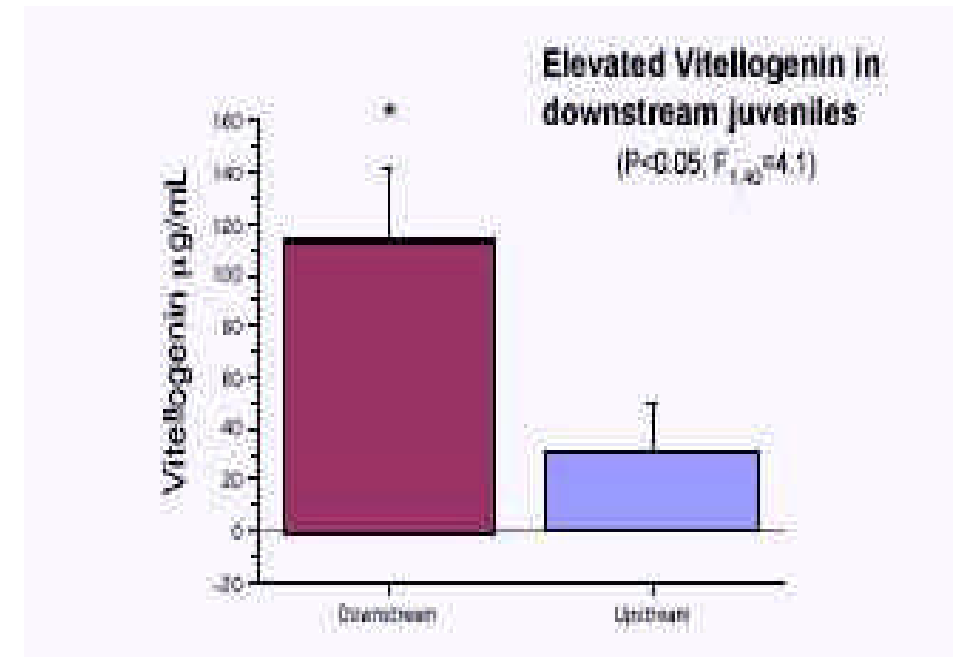

- Intersexed males (male fish with oocytes in testes) not found at reference sites but were found downstream of wastewater plant outfall
- Skewed sex ratios found predominantly downstream of discharge

Boulder Creek, Colorado

- Elevated vitellogenin observed in downstream juvenile white suckers
- Vitellogenin is normally produced by the liver in female fishes and is transported to the ovaries via the bloodstream where it stimulates egg production and becomes egg yolk
- Juveniles and males should have very low or no vitellogenin in their blood plasma

Boulder Creek, Colorado

February 2010 | 20

Potomac Drainage Studies

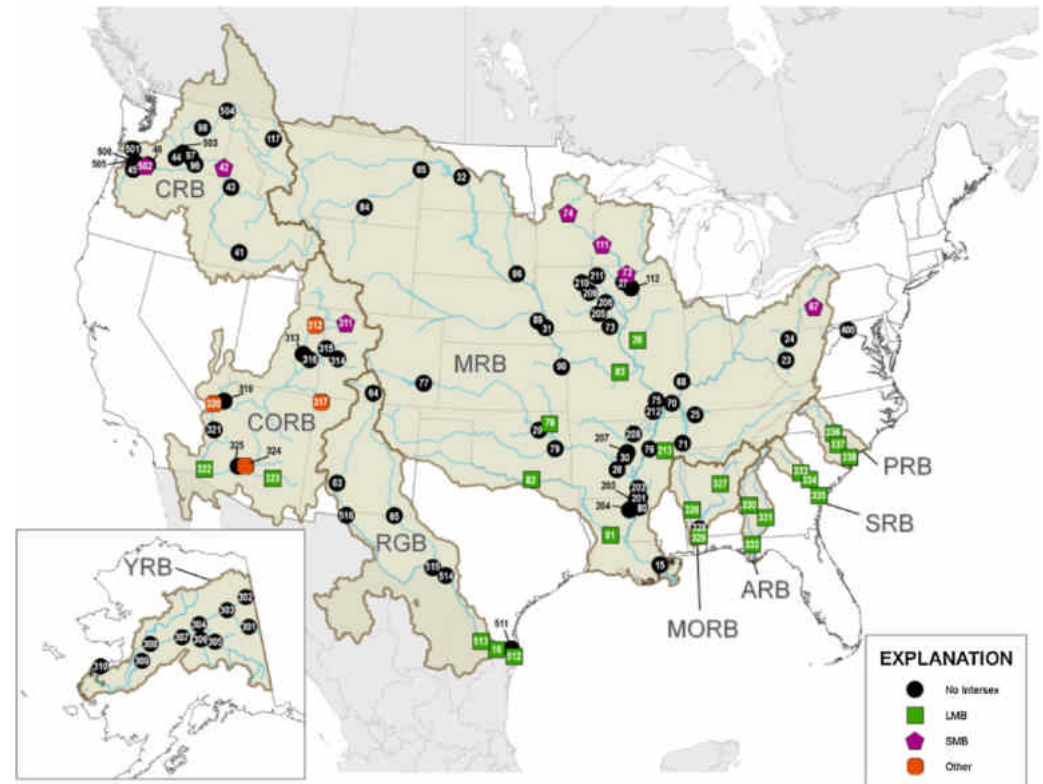

- Higher incidences of intersexed and infected fishes in developed drainages when compared to less disturbed drainages
- Male fishes with elevated Vitellogenin
- Estrogenic activity 532 to 748-fold greater in sediments than in overlying water, suggesting strong partitioning and accumulation in sediments

USGS Report on Intersex Black Bass in U.S. Rivers 1995-2004

- Incidence of intersex greatest in Southeastern United States, why?

USGS Report on Intersex Black Bass in U.S. Rivers 1995-2004

- Did not observe significant correlations between incidents of intersex at Apalachicola sites and other EDC exposure endpoints (vitellogenin, 17β -estradiol)
- Intersex did not always occur in areas with suspected sources of EDCs
- Exposures to EDCs intermittent? Other causes?

*Widespread Endocrine Disruption and
Reproductive Impairment in Atlantic croaker
Exposed to Seasonal Hypoxia*

Peter Thomas

University of Texas at Austin

**Collaborators:
Dr. Md.S. Rahman
J. Kummer
Dr. I.Khan**

Endocrine Disruption and Hypoxia

- Through a series of field and laboratory experiments, Univ. of Texas researchers were able to demonstrate that exposure to low dissolved oxygen waters can cause disruption of endocrine system and lead to reproductive effects
- Must use caution when interpreting endocrine disruption effects

Conclusions

- There is currently a shortage of studies specifically designed to measure the responses of biological communities to PPCPs
- Laboratory and field studies to date indicate that there is potential for environmental impacts, but more research needs to be done to determine effects at environmentally relevant concentrations and in complex mixtures
- Science Progresses in Stages
- We are at the stage where studies to determine causes and effects in natural systems is possible
- Due to the rapid increase in the number of new PPCPs and other contaminants entering the environment, compound specific testing is not sufficient, can't keep up
- Need to look for indicators of exposure to classes of contaminants (e.g., measuring overall estrogenicity)

Conclusions, cont.

- New studies should examine effects to populations or communities (both animal and human) exposed to PPCPs at environmentally relevant concentrations
- Causal relationships between PPCP exposure and effects should be demonstrated using a combination of laboratory and field experiments
- Research also needs to be conducted to develop better wastewater treatment technologies that improve removal efficiencies for PPCPs
- All of this takes money. Let your representatives know that this is important to you.
